(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pubmoly [4] 4732114 [$pl.AR129072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="PCR was performed on Arabidopsis thaliana lines each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligomuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pWADA2 (gil 4/3/2114 [gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transfermed into chemically-competent B. coli XII.0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1..25

```
was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWA2 (gil 4732114 |gb|AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Contact: Robert B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ठ
                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pware (pware) a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 E

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwdy1472114[ph]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xillo-Gold (stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EST 11-DEC-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            H96935

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|q102114|gb|APL20072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Contact: Robert B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                      (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR123072.1). a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli K110-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Contact: Robert B. ```

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pwapto (giff) 4732114[p] AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xillo-Gold (Stratagene) cells and selected for ampicillin resistance."

In vitro cloning of complex mixtures of DNA on microbeads: Physical separation of differentially expressed cDNAs
Proc. Natl. Acad. Sci. U.S.A. 97 (4), 1665-1670 (2000) AW059679 24 bp mRNA linear EST 23-AUG-2000 AHUTH.bsst.dnc15.aa.A050g08 DNC15 Homo sapiens cDNA, mRNA sequence. AW059679

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunch orifice at constant velocity. The sheared DNA was blunch end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMA2 (gql 4732114|gbl=A129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xillo-Gold (stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarese gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114 |gb|APL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the innert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GSS 27-APR-2001

polynucleotide, for therapeutic purposes, for studying expression and function of the polynucleotide and for expressing the phospholipase Novel isolated human Phospholipase A2, Group IB pancreas protein

Claim 19; Page 13; 51pp; English

The invention relates to an isolated human Phospholipase A2, Group IB (pancreas) (PLA2GIB) polymucleotide comprising a sequence which is a polymuchic variant for a reference sequence for the PLA2GIB gene or its fragment, or a polymuchic variant of a reference sequence for a the PLA2GIB gene of an individual, preddicting the haplotype pair for the PLA2GIB gene of an individual, preddicting the haplotype pair for the CLA2GIB cDNA or its fragment. Also included are haplotype pair for the PLA2GIB gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLA2GIB gene, an isolated genorching oligomoutlectide for detecting a polymorphism in the PLA2GIB gene, a recombinant non-human organism expresses a PLA2GIB gene, an isolated genome, where the organism expresses a PLA2GIB with the PLA2GIB sequence, where the organism expresses a PLA2GIB protein encoded by the first nucleotide sequence or by the polymorphic variant sequence, an isolated polypeptide comprising a sequence which is a polymorphic variant of a reference sequence for the PLA2GIB protein or transferted polymorphism data for the PLA2GIB monoclonal antibody, screening for drugs targeting PLA2GIB, a computer system for storing and analysing polymorphism data for the PLA2GIB gene and a genome anthology for PLA2GIB polymorphism data for the PLA2GIB gene and a genome anthology for PLA2GIB corputors of the PLA2GIB variant is useful in studying the efficiacy of therapeutic purposes. The transgenic crancer) and for testing the efficiacy of therapeutic agents and pancreatic cancer) and for therapeutic purposes. The transgenic organism is useful for studying expression of the PLA2GIB isogenes in vivo, for in vivo screening and testing of drugs targeted against PLA2GIB protein, and for testing the efficiacy of therapeutic agents and compounds in a biological several changing plA2GIB. The PLA2GIB sevel as on the binding all places of the pla2GIB section of the PLA2GIB sevel as well as on the binding of the plac polymorphisms in PLA2GIB. EEFFXEXERSCOSSSSSSSSSSSSSSSSSSSSSSSSSSSSS

The invention comprises peptide nucleic acid (PNA) oligomers, where the single units of the oligomers comprise different amino acid backbones selected from any amino acid, such as: including aminoethylglycine (aeg); aminoethylprolyl (aep); and aminoethylprolyl (aep); The PNA oligomers of the invention are useful for the downregulation of specific genes by targeting the genes at the mRNA or DNA level. The PNA oligomers are useful for treating bacterial and viral infections, cancer, metabolic diseases and immunological disorders. The PNA oligomers are also useful in PCR monitoring/modulation by PNA-clamping. The present DNA sequence represents a PNA oligomer of the invention.
                    /note= "This sequence is a peptide nucleic acid, (i.e. contains a polyamide backbone instead of a deoxyribose backbone"

The invention relates to a nucleic acid array (I) comprising at least one hybridisation feature and at least one background feature. (I) is useful for detecting the presence of an analyte nucleic acid in a sample. The detection comprises contacting the nucleic acid array with the sample under stringent hybridisation conditions, subtracting the background corrected hybridisation signal to obtain a background corrected hybridisation signal and relating the background corrected hybridisation signal and relating the background corrected hybridisation signal and relating the background corrected hybridisation algoral to the presence of the analyte target nucleic acid in the sample analyte target nucleic acids present in the sample with a member of a signal producing system prior to contacting the array with the sample. ABK99529-ABK99544 and ABK99549-REF9578 represent nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; 88; primer; SNP; single nucleotide polymorphism; pancreatitis; pancreatic cancer; phospholipase A2 grouplB; PLAZG1B; gene therapy; haplotype; genotype; chromosome 12q23-q24.1; transgenic; drug screening; ASO; allele specific oligonucleotide; primer extension.
                                                                                                                                                                                  Nucleic acid arrays for qualitatively or quantitatively determining the presence of analyte target nucleic acid in a sample comprises both hybridisation features and background features -

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (3) a method (M2) for screening candidate attifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for identifying human genes which are involved in cell cycle expression comprising contacting human DNA with a probe which comprises at least 10 contiguous nuclectides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell with call cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs.

The AFP135CB to AFF4064 the prepresent SAGE tags used in the exemplification of the cell cycle.
                                                                                                                                                                                                                                                                                                         Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    primers used in the SAGE method, in the exemplification of the present

The invention relates to a method for detecting the presence and/or amount of a target nucleotide sequence in an analyte. The method comprising: contexting an aliquot of an analyte suspected of containing the target sequence with a set of features comprising oliophosphodiester probes; and subtracting a background signal from an observed signal to determine the presence and/or amount of the target sequence in the analyte. The method is used to detect the presence and/or amount of a target sequence in an analyte. The method is used for estimating background noise in a nucleic acid hybridisation assay and for validating a test-background feature. The method is useful in chemical, biological medical and diagnostic techniques, and for drug diacovery. The present sequence is a probe used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                             Detecting a target nucleotide sequence in an analyte, for use in e.g. drug discovery, comprises using a set of features having oligophosphodiester probes, and subtracting a background signal from an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PNA oligomer; PNA; peptide nucleic acid; polyamide backbone; ss; aminoethylglycine; aeg; aminoethylglycine; aeg; amorethylgrollidine; enterethylglycine; appectant infection; viral infection; cancer; metabolic disease; immunological disorder; PNA-clamping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a vest cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affect phases of the cell cycle, the differentially expressed genes may be used to study, monitor and affect phases of the cell cycle, the cell cycle. The methods may be used as markers of phases of the cell cycle, and the differentially expressed genes may be used of an arkers of phases of the cell cycle, and feet the cell cycle, the cell cycle, and continued and per identification of an interventional continued and per identification of an intervention of a continued of AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle Example; Page 202; 419pp; English. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle -

Example; Page 233; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonanocated ORF) genes comprising a SAGB (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast earl; and (b) monitoring expression of a noRF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for identifying human genes which modifies the expression comprising contacting human DAM with a probe which comprises at least 10 contacting human plan are involved in cell cycle or identifying human genes which are involved in cell cycle or as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug as a candidate drug and monitoring expression in the yeast cell of at least 10 contiguous nucleotides of a NORF gene whose expression waries or expression in a yeast cell comprising contacting a yeast cell of at least 10 condidate drug and monitoring expression in the yeast cell of at least 10 condidate expression in a yeast cell comprising contacting a yeast cell of at least 10 condidate in a yeast cell comprising contacting a yeast cell of at least 10 contacting expression in the yeast cell of the cell cycle. The methods may be used as markers of phases of the cell cycle. The differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs and provided the cell cycle identify candidate drugs and provided the cell cycle identify candidate drugs and provided the cell cycle identify candidate drugs and provided the cycle identify candidate of and suppose the cell cycle identify affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44664 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present

```
transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts transcribts that are upregulated in metastatic breast transcripts.

AA2883942 to AA288677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic colls). AA2883942 to AA288677 represent tags corresponding to distinct transcripts that metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic blagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected promoters from the transcripts are used to direct expression, in selected sequences), particularly an antigenenceded by the transcripts are also call-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; (bot diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides can be used the expension of solate populations of educated, antigen encoding is or as therapeutic agents. Host cells that produce the polypeptides can be used of the expension of the expension of the educated, antigen encoding and controlled to the controlled of the encoded of the polypeptides can be used to expense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to expand and isolate populations of educated, antigen-specific effecter cells, e.g. cytotoxic T lymphocytes, and these used for

The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the CDNA of each gene has the base sequence of (AAH32628 to AAH32673) continuous to the base sequence 5'-CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human disease in which human monocyte plays an important role.

AAH35628 to AAH32943 represent specifically claimed LPS activated human monocyte expression gene cDNA tags from the present invention. AAH3294 represents an LPS activated human monocyte expression gene cDNA tags from the present invention. AAH3294 encoding AAB98009, which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yeast, Saccharomyces cerevisiae; characterisation, cell cycle, NORF, nor previously assigned open reading frame; nonannotated ORF, SAGE, serial analysis of gene expression; antifungal; tag; identification;

for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergically mediated inflammation (atopic or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production promote apoptosis in epithelial cells (e.g. for treating vitiligo), and to promote apoptosis in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell in the sequence is melanogenesis associated oligonucleotides are used to oligonucleotides used to inhibit mammalian epithelial cell the proliferation, described in the method of the invention.
  resulting in transient arrest of cell growth, allowing more time
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SAGE tag, serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL;

complexion tages used to ladentity mived transcripts encoding cimumostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or stressed expense that services a variety or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while cother transcripts correspond to novel genes. Antisque-presenting cell derivation of the cytotoxic immune response, particularly against tumour cells. Tumour antisque presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory coffactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly expressed genes in a APC; and as hybridisation probes/amplification primers for the against a tumour antigen; to modulate the genotype of an APC; to an as hybridisation of the dendritic cell captoris and monitoring of diseases related to abnormal expression of these genes. Detection of their dendritic cell captoris and monitoring of diseases related to abnormal capteratially expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate the genes can be used in active immunotherapy (or to stimulate the genes can be used in active immunotherapy (or to stimulate the presentation of co-stimulatory signals, migration to T cell-rich sites, co-captor cells or the presentation of co-stimulatory signals, migration to T cell-rich sites.
                                                                                                                                                                                                                                                                                                  Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Metastatic breast tumour cell downregulated transcript tag #5659.

23-NOV-1999 AAZ10692; Cobied to the control of the control

The invention describes inhibition of mammalian epithelial cell
proliferation by treating cells with at least one oligonucleotide, or
its fragment. The compounds, which have cytostatic, anti-allergic,
anti-inflammatcry, dermatclogical, ophthalmological, anti-psoriatic and
immunosuppressive activities, function as 'ultra-violet mimics' to induce
the property processes (or a protective response to later exposure to
radiation or chemicals), as a proliferation inhibitor, apoptosis inducer
or a tumour necrosis factor inhibitor. Probably they mimic products of
the processed DNA-damage intermediates, by inducing the p53
pathway, resulting in transient arrest of cell growth, allowing more time
for DNA repair to occur before cell division takes place. The method is
for DNA repair to occur before cell division takes place. The method is
comparable to treat carcinoma but may also be used to: treat other
hyperproliferative states (e.g. psoriasis or precancerous conditions);
reduce photoaging, oxidative stress or damage; prevent skin cancer; treat
allergically mediated inflammation (atopic or contact dermatitis,
allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in
cells caused by radiation or chemicals; increase melanin production
(pigmentation) in epithelial cells that contain damaged DNA, also
promote apoptosis in aptihelial cells that contain damaged DNA, also oligonuclectides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonuclectide #7, one of the oligonuclectides used to inhibit mammalian epithelial cell proliferation, described in the method of the invention.

The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or lite fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, obthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Melanin, melanogenic; oligomer; cytostatic; anti-allergic; p53; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; tumunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                       AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV minetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 7; DB 20; I 100.0%; Pred. pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other the carcinoma but may also be used to: treat other carcinoma but may also be used to: treat other the precauce of the cancer of the cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in calls caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells that contain damaged DNA. Also oligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonucleotide #3, a truncated version of the oligonucleotide shown in AAS14906, one of the oligonucleotide shown in AAS14906, one of the oligonucleotide in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                              ö

```
AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV mimetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 5 BP; 2 A; 2 C; 0 G; 1 T; 0 other;

PT DNA fragments useful for increa susceptibility to UV-induced hy. XX
Claim 11; Page 30; 44pp; Englis XX
AA10692-97 represent DNA fragment cc cerivity in a cell. The oligomucic or cemicals. The oligomucicides in a cell, reducing the susception of the condition of the condition
```

Eller M;

```
The invention describes inhibition of mammalian epithelial cell

proliferation by treating cells with at least one oligonucleotide, or

the fragament. The compounds, which have exposetatic, anti-allergic,

anti-inflammatory, dermatological, ophthalmological, anti-allergic

anti-inflammatory, dermatological, ophthalmological, anti-allergic and

immunosuppressive activities, function as 'ultra-violet mimics' to induce

to an tumour necrosis factor inhibitor. Probably they mimic products of

DNA damage, or processed DNA-damage intermediates, by inducing the p53

cor a tumour necrosis factor inhibitor. Probably they mimic products of

DNA damage, or processed DNA-damage intermediates, by inducing the p53

pathway, resulting in transient arrest of cell growth, allowing more time

for DNA repair to occur before cell division takes place. The method is

cor byperproliferative states (e.g. psoriasis or precancerous conditions);

reduce photoaging, oxidative stress or damage; prevent skin cancer; treat

allergically mediated inflammation (atopic or contact dermatitis,

allergically mediated inflammation (atopic or contact dermatitis,

allergically mediated inflammation (atopic or contact dermatitis,

cells caused by radiation or chemicals; increase melanin production

(pigmentation) in epithelial cells (e.g. for treating vitiligo), and to

colls acused by radiation or chemicals; increase melanin production

(pigmentation) in epithelial cells (e.g. for treating vitiligo), and to

colls equence is melanogenesis associated oligonucleotide #4, a truncated

version of the oligonucleotide shown in manalian epithelial cell

colligration, described in the method of the invention.

                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-allergic, anti-inflammatory, dermatological, onthalmological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet minics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis induce or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other
                                                                                                                                                                                                                                                                                                                                                   anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; immunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hyperproliferative states (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in cells caused by radiation or chemicals; increase melanin production (pigmentation) in epithelial cells (e.g. for treating vitiligo), and to promote apoptosis in epithelial cells that contain damaged DNA. The oligonucleotides are are UV mimetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, vitiligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                          p53 activity; UV mimetic; UV-irradiation; UV-induced dermatosis; UV-induced hyperproliferative disease; psoriasis; vitiligo; atopic dermatitis; allergic rhinitis; conjunctivitis; photoaging;
                                                                                                                                                                                                                     Oligonucleotide sequence that increases p53 activity in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-OCT-2001.
                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.
                                                                        AAS14911;
AAS14911
                         The invention describes inhibition of mammalian epithelial cell proliferation by treating cells with at least one oligonucleotide, or lits fragment. The compounds, which have cytostatic, anti-albragic, anti-inflammatory, dermatological, ophthalmological, anti-albragic, anti-inflammatory, dermatological, ophthalmological, anti-inflammatory dermatological, ophthalmological, anti-albragic and immunosuppressive activities, function as 'ultra-violet mimics' to induce DNA repair processes (or a protective response to later exposure to radiation or chemicals), as a proliferation inhibitor, apoptosis inducer or a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 pathway, resulting in transient arrest of cell growth, allowing more time for DNA repair to occur before cell division takes place. The method is especially used to treat carcinoma but may also be used to: treat other hyperproliferative streats (e.g. psoriasis or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA, and to colligonucleotides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cells that contain damaged by the contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cells every of the oligonucleotide shown in AASI4906, one of the oligonucleotide shown in AASI4906, one of the oligonucleotide so the inhibit mammalian epithelial cell
                                                                                                                                           Melanin, melanogenic; oligomer; cytostatic; anti-allergic; p53; anti-inflammatory; dermatological; ophthalmological; anti-psoriatic; ammunosuppressive; DNA repair; proliferation inhibitor; apoptosis; tumour necrosis factor inhibitor; photoaging; hyperproliferative disease; carcinoma; oxidative stress; skin cancer; allergy mediated inflammation; conjunctivitis; allergic rhinitis; vitiligo; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonuclectides that mimic the effects of ultra-violet light
                                                                                               Melanogenesis associated oligonucleotide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Seguence 7 BP; 3 A; 0 C; 2 G; 2 T; 0 other;

proliferation by treating cells with at least one oligonucleotide, or its fragment. The compounds, which have cytostatic, anti-placegic, arti-inflammentory, dermatological, anti-psoriatic and immunosuppressive activities, function as 'ultra-violet mimics' to induce immunosuppressive activities, functions a' ultra-violet mimics' to induce cradiation or chemicals), as a proliferation inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 cor a tumour necrosis factor inhibitor. Probably they mimic products of DNA damage, or processed DNA-damage intermediates, by inducing the p53 cor processed DNA-damage intermediates, by inducing the p53 cor processed DNA-damage intermediates, by inducing the p53 cor processed DNA-damage in transient arrest of call growth, allowing more time for DNA repair to occur before call division takes place. The method is especially used to treat carcinoma but may also be used to: treat other corpustions or precancerous conditions); reduce photoaging, oxidative stress or damage; prevent skin cancer; treat allergically mediated inflammation (atopic or contact dermatitis, allergic rhinitis and conjunctivitis); prevent or reduce DNA damage in calls caused by radiation or chemicals; increase melanin production corpus approach apoptocial calls calls that contain damaged DNA, also promote apoptocial calls calls calls contain damaged DNA, also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       oligonuclectides that contain non-hydrolyzable backbones are used to inhibit apoptosis, in response to DNA damage, in epithelial cell. This sequence is melanogenesis associated oligonucleotide #7, one of the oligonucleotides used to inhibit mammalian epithelial cell proliferation, described in the method of the invention.
                                                                                                                           invention describes inhibition of mammalian epithelial cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 7 BP; 3 A; 0 C; 2 G; 2 T; 0 other;

```
(MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifs that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. Such utrons can be used to regulate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC class I or II, ICAM-7, B7-1, B7-2, FC gamma R, IL-2 or HIV gene expression. They can be used to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transplant rejection, or treat an autoimmune or inflammatory disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a promoter regulatory element, found in the utrons of the invention. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interactions. The utron is able to suppress constitutive and interferon-gamma (IFN-gamma) induced major histocompatibility complex
                                                                                                                                                                                                                                                                                                                                               3' untranslated region; UTR; inhibition; gene expression; ICAM-7; interferon-gamma; IFN-gamma; major histocompatibility complex; MHC; antigen expression; gene promoter; utron; B7-1; B7-2; Fc gamma R;
                                                                                                                                                                                                                                                                                                               A promoter regulatory motif found in the utrons of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Utrons, RNA molecules containing promoter regulatory motifs -useful to suppress express expression from promoter of interest, specifically TSU nucleic acid suppression of MHC Class I and II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses non-integrating viral vectors comprising a polymucleotide flanked by inverted repeats that bind a transposase, a transposase-encoding polymucleotide operably linked to a regulatory sequence comprising an operator, that alters expression of the ransposase-encoding polymucleotide. Transposon sequences can integrate into genemic DNA whether or not the cell is dividing. AGSB10 is a SB (Sleeping Beauty) transposae-transducing adenoviral non-integrating vector. The non-integrating viral vectors are useful for treating vector. The non-integrating viral vectors are useful for treating vector. The non-integrating viral vectors are useful for treating vector. The non-integrating viral vectors are useful for treating control of supplementation of a metabolic activity. These genetic disease characterised by subnormal production of a polypeptide or brain malfunction. The non-integrating viral vectors are useful as nucleic acid delivery systems, e.g. for genome analysis or gene therapy and can also be used for applications that involve long-term production of a polypeptide. The non-integrating viral vectors are also useful for creating transgenic host cells that provide normal cells with protection against toxic side effects of chemotherapy.

The sequence of the present invention is a direct repeat sequence that

This is a nonamer consensus sequence of a cyclin D transcription factor

DMP1. DMP1 is an amino acid polymer which has binding affinity for a
D-type cyclin, in vitro, and for a specific DNA mucleotide sequence and
is a transcription factor involved in the activation of genes that
prevent cell proliferation. The DMP1 nucleic acid is operatively linked
to an expression control sequence on an expression vector. The expression
vector has a transcription control sequence comprising this nonamer
sequence operably associated with a recombinant gene or a cassette
insertion site for a recombinant gene. The vector is homologoually
recombined in a chromosome of a transgenic animal. A probe or a
competitor in DMP1 transactivation assays is designed based on this
competitor in DMP1 transactivation assays is designed based on this
competitor in DMP1 transactivation assays is designed based on this
competitor in DMP1 the probe under conditions that allow binding of the
from a mammal with the probe contains the core sequence GTA, and where
the presence or activity of DMP1 is suspected in the sample. DMP1 can
function as a cell cycle inhibitor when expressed in a tumour cell.
Modulating the expression of DMP1 can be used to treat tumour cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancers. DMP1 can also be used for controlling expression of heterologous proteins. Antisense sequences and ribozymes can be used to inhibit expression of the transcription factor. Detecting the level and activity of DMP1 in cells is useful for detection of cancer cells or

                                                                                The present sequence represents a GAS complement gene promoter motificand in a trophoblast STAT utron (TSU). TSUS be isolated from a CDNA library prepared from mRNA isolated from trophoblast cells. Utrons are from, or are homologous to, the 3' untranslated region (UTR), of an mRNA that stimulates or inhibits a cellular response by sequence specific interfactions. The TSU is able to suppress constitutive and interfacton-gamma (IRN-gamma) induced major histocompatibility complex (MHC) class I and class II antigen expression and expression of other antigens, the gene promoters of which contain related sequence motifis that are stimulated by the same factors which stimulate MHC class I and class II antigen expression. The TSU sequence contains motifis related to IRN afgnalling (GAS, ISRE and interleukin-4 response elements). The nucleic acid can be used to regulate gene expression in a subject, e.g. a human or a cell in vitro, specifically inhibiting MHC Class I or II, can be used to inhibit transplant rejection, or treat an autoimmune or used to inhibit the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAZ10692-97 represent DNA fragments that are used for increasing p53 activity in a cell. The oligonucleotides are are UV minetics and protect cells against subsequent exposure to UV-irradiation or chemicals. The oligonucleotides are useful for increasing p53 activity in a cell, reducing the susceptibility to UV-induced hyperproliferative diseases, treating psoriasis, viciligo, atopic dermatitis, allergic rhinitis, conjunctivitis, and UV-induced dermatoses, reducing photoaging and reducing susceptibility to skin cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA fragments useful for increasing p53 activity in a cell and reducing susceptibility to UV-induced hyperproliferative diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention describes inhibition of mammalian epithelial cell

cris fragment. The compounds, which have cytostatic, anti-allergic,

anti-inflammatory, dermatological, ophthalmological, anti-allergic,

anti-inflammatory, dermatological, ophthalmological, anti-allergic,

anti-inflammatory, dermatological, ophthalmological, anti-allergic and

immunosuppressive activities, function as 'ultra-violet mimics' to induce

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor. Probably they mimic products of

con a tumour necrosis factor inhibitor and may also be used to: treat carcinoma but may also be used to inhibit apoptosis in epithelial cells (e.g. for treating vitiligo), and to

contact callergic rhinitis and conjunctivitis); prevent or reduce DNA damage in

colls caused by radiation or chemicals; increase melanin production

copyromote apoptosis in epithelial cells (e.g. for treating vitiligo), and to

contact anone apoptosis in response to DNA damage, in epithelial cells (e.g. for treating vitiligo), and to

contact anone apoptosis in response to DNA damage, in epithelial cells (e.g. for contact contain damaged by

contact centact contain non-hydrolyzable backbones are used to

contact centact contain non-hydrolyzable backbones of the

colligonucleotides used to inhibit mammalian epithelial cell in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting proliferation of epithelial cells, useful e.g. for treating carcinoma, using specific oligonucleotides that mimic the effects of ultra-violet light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a differential display comprising contacting cDNA with a first primer that hybridises to an oligonucleic sequence couling for a leucine-rich motif, and with a second oligonucleotide primer to form a cDNA-hybrid molecule. The method comprises obtaining mRNA from at least 2 samples, synthesising cDNA from the RNA of each sample, contacting the cDNA with a first primer that hybridises to an oligonucleotide primer to form a leucine-rich motif, and with a second oligonucleotide primer to form cDNA-hybrid molecules, detecting amplified products and comparing the amplified products from each sample to identify distinctive amplified products coding for at least one secreted or transmembrane protein. The method is useful for discovering novel secreted and/or transmembrane proteins which are important for cell processes and play an important role in determining its phenotype, and which act as mediators for the transfer of signals from expression. Sequences ABX03772-ABX03790 represent PCR primers used in the differential display method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                 Differential display method for identifying secreted or transmembrane protein, comprises contacting a DNA with a first primer that hybridizes to a sequence coding for a leucine-rich motif and with a second oligonucleotide primer -

that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71211 to ABQ72214 and ABP48191 to ABSF1230 represent DNA target sequences and zinc finger peptides which are given
                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3-5-5 direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (S3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such
                                                                                                                                                                                                                                                               New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

We are not submitting the same cDNA sequence redundantly to DDBJ
Since 1993. For the abundance information of clones with this sequence in this library and as well as in other 3'-directed libraries, see 'http://www.imcb.osaka-u.ac.jp/bodymap'. The sequences of the clones represented by this GS sequences is also found there.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

/note="Vector: pT7135-pac (Pharmacia) with a modified
polylinker; lst strand cDNA was prepared from 3 pooled
germ cell tumors, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT713
vector. Library is normalized. Library was constructed by
Bento Soares and M. Fatima Bonaldo. "
